

Here are full speaker notes for the 8-slide deck, written in delivery voice with timing, demo cues, and the honesty beats. Total lands at ~19 minutes, leaving a minute for questions.

**Slide 1 — Title (0:00–0:30)** Don't read the title slide. Walk on and open cold with a line, not the topic — something like: "Every team in this room has been told the same lie: that you can have a capable AI agent, or you can keep your data where the regulator wants it, but not both. I want to show you that's false." Let the title sit behind you while you say it. The "0 bytes to cloud / airplane mode" device on the right is doing the work — don't explain it yet, just let people notice it.

**Slide 2 — The tension (0:30–2:30)** This is your hook; spend real time here. Walk the left column first — regulation isn't a preference any more, it's a hard constraint: GDPR, India's DPDP Act, sector mandates in health, finance, defense. Residency is non-negotiable and every automated decision has to be auditable. Then turn to the right column with a slightly dry tone — "and here's what the default AI stack does: it ships the data to a cloud endpoint and hopes for the best." Pause on "hopes for the best." Land the three costs — tokens, latency, and the killer: it fails completely in a dead zone. Close on the italic line: "What if you didn't have to choose?" — then advance. Don't rush this; the whole talk only works if they feel the tension first.

**Slide 3 — Thesis & architecture (2:30–5:00)** State the thesis in one breath, looking at the room, not the slide: "MCP's real value at the edge isn't tool-calling — it's that the protocol becomes the single point where you decide what model runs, which tools are allowed, and which governance rule applies. One local decision, zero PII leaving the device." Then trace the pipeline left to right with your hand — UI, client wraps it with a scoped token, server orchestrates, the security gate, the registry routes, inference runs. Here's the line to slow down and own: "We kept the protocol and deleted the server." Pause for it — it's your most quotable moment and the engineers will react. Then the two halves: capability (real models, real MCP, all in-process) and constraint (zero egress makes compliance structural, not a policy binder). Transition: "So how does one decision enforce three different things? That's the control plane."

**Slide 4 — The control plane (5:00–7:00)** This is your executive anchor — tell CXOs explicitly "if you screenshot one slide, screenshot this one." Walk the three pillars as one system, not three features. Security: a guard model plus hardware-signed capability tokens decide what's even allowed to run. Governance: the server and the 0.75 router decide what runs and where data may go — which is nowhere. Auditing: every decision is signed and provable on-device. The point to hammer: these aren't bolt-ons you add later, they're enforced in the same pass, before any model runs. Read the bottom strip out loud — "all three on-device, zero egress, DPDP and GDPR by construction." Transition: "Let me show you the first two actually working."

**Slide 5 — Security & governance + demo (7:00–11:00)** Two halves, two questions. Left: security asks two *different* questions — Gate 1, GuardModel, asks "is this content safe?" and fails closed on jailbreak, PII, safety; Gate 2, IamService, asks "is this caller authorized?" and checks an ES256 scope with a key that lives in the hardware Keystore. Make the point that these are orthogonal — a safe prompt from an unauthorized caller still gets rejected. Right: once you're allowed to run, the 0.75 router decides *where* — 80% resolve on the

sub-300ms SLM path, harder ones pull RAG, only the genuinely hard ones hit the 7B. Then the governance leap, which is your most original technical point: "the router is also where a data-sensitivity policy lives — a PII-flagged query gets pinned to the local path and is forbidden from escalating." Now the demo: under-scoped token rejected before any model runs, then the triage confidence walk — 0.93 returns instantly, 0.62 drops below threshold and triggers RAG, 0.91 returns — all with the phone offline. Honesty beat, say it plainly: the SLM and RAG confidence are real, from logits; the LLM-path score is a placeholder today, and the threshold is a tunable knob, not finished science. (Practical: pre-warm the app before you go on, and have the fallback recording cued.)

**Slide 6 — Data governance & auditing + demo (11:00–14:30)** Left: the data never leaves, and that's enforced by the data flow, not a document. Residency — zero bytes leave the device or jurisdiction. Minimisation — PII is redacted before anything is stored, capped per session. Purpose — scoped tokens gate what each tool can even read. The punchline for the compliance people: "DPDP and GDPR aren't satisfied by controls and audits here; they're satisfied by construction." Right: auditing — every outcome, blocked or unauthorized or answered, leaves a signed, append-only record with the path, confidence, latency, agent, scopes, and timestamp, exportable to compliance or responders on reconnect. Demo: trigger a block, open the AuditLog viewer, the signed record appears — still offline. Honesty beat, point at the footnote: the signing today is SHA-256 with a salt; the keyed-HMAC upgrade makes the tamper-evidence claim fully defensible — so say "signed, with keyed-HMAC hardening in progress" unless you've shipped that fix before the talk. Owning that gap reads as senior, not weak.

**Slide 7 — Six verticals + ROI (14:30–16:30)** Zoom out to the platform claim. "Everything you just saw is domain-agnostic — to ship a new vertical you swap three files; the entire control plane stays identical." Frame each vertical as a governance policy bundle over a constant core — healthcare loads a clinical+DPDP policy, finance an RBI-style one, defense an air-gap one. Then drop one ROI number hard and let it sit — "\$450K a year of Salesforce Einstein displaced per 500 reps" is the one that moves product VPs. Don't read all six verticals aloud; gesture at them and move. Transition: "Before I close, let me be honest about what's real."

**Slide 8 — Real vs roadmap + close (16:30–19:00)** This is the slide that gets you hired, so deliver it with confidence, not apology. Walk "working today" plainly — in-process MCP, scope enforcement, real SLM/RAG routing, the offline audit log. Then "on the path" without flinching — keyed-HMAC, inbound JWT re-verification, Gemma 2B and model-agnostic routing, per-domain policy. The meta-point, say it out loud: "a room of maintainers trusts the person who draws this line themselves." Then move into the close band — restate the spine in one breath: "Capability without the cloud. Compliance without the binder." Make the ask explicit and low-friction: "If you're building agents under DPDP, or anywhere the network can't be trusted, come find me — I'm here all day." Point at the contacts, stop talking, take questions. If you're over time, the audit demo on slide 6 is the safest thing to have compressed to a screenshot.

Two delivery reminders that apply across the whole deck: pre-warm the models before you walk on so first-query latency doesn't surprise you, and have a screen-recording of all the

demos cued — "in case the demo gods aren't kind" buys you total forgiveness if live inference stalls.
